# EXAM - BASIC STATISTICS FOR ECONOMISTS 

 2022-02-11Time: 08.00-13.00
Approved aid: Hand-held calculator with no stored text, data or formulas
Provided aid: Formula Sheet and Probability Distribution Tables, returned after the exam, English-Swedish dictionaries available on site

## - Problems 1-5: MULTIPLE CHOICE QUESTIONS - max 60 points

- A total of 12 multiple choice questions with five alternative answers per question one of which is the correct answer. Mark your answers on the attached answer form.
- Marking more than one alternative will result in zero points for that question.
- Written solutions should not submitted; only your answers on the answer form will be considered in the assessment and final grading.

## - Problems 6 - 7: COMPLETE WRITTEN SOLUTIONS - max 40 points

- Use only the provided answer sheets when submitting your solutions and answers.
- For full marks, clear, comprehensive and well-motivated solutions are required. Unclear and unexplained solutions may result in point deductions even if the final answer is correct.
- Check your calculations and solutions before submitting. Careless mistakes may result in unnecessary point deductions.
- The maximum number of points is stated for each question. The maximum total number of points is $60+40=100$. At least 50 points is required to pass (grades A-E). The grading scale is as follows:

A: $\quad 90-100$ points
B: $\quad 80-89$ points
C: $70-79$ points
D: $60-69$ points
E: $\quad 50-59$ points
Fx: $40-49$ points
F: $0-40$ points
Note! Fx and F are failing grades that require re-examination. Students who receive the grade Fx or F cannot supplement for a higher grade.

- Solutions will be posted on Athena shortly after the exam.

## GOOD LUCK!

## Problem 1

The table below shows the total number of eligible voters (in thousands) and the percentage of them who voted in the election for Swedish parliament 2014, by age category and sex.

|  | Men |  | Women |  |
| :--- | :---: | :---: | :---: | :---: |
| Agre group | Eligible voters <br> $\mathbf{1 0 0 0 s}$ | Voted, percent <br> \% | Eligible voters <br> $\mathbf{1 0 0 0 s}$ | Voted, percent <br> \% |
| $\mathbf{1 8 - 2 4}$ | 420 | 79,3 | 393 | 83,3 |
| $\mathbf{2 5 - 2 9}$ | 290 | 78,9 | 286 | 84,0 |
| $\mathbf{3 0 - 3 4}$ | 269 | 82,5 | 265 | 85,4 |
| $\mathbf{3 5 - 3 9}$ | 276 | 85,3 | 267 | 86,8 |
| $\mathbf{4 0 - 4 4}$ | 307 | 87,0 | 302 | 89,0 |
| $\mathbf{4 5 - 4 9}$ | 321 | 85,5 | 320 | 88,2 |
| $\mathbf{5 0 - 5 4}$ | 300 | 86,7 | 292 | 88,8 |
| $\mathbf{5 5 - 5 9}$ | 281 | 86,9 | 279 | 91,0 |
| $\mathbf{6 0 - 6 4}$ | 277 | 88,2 | 277 | 90,8 |
| $\mathbf{6 5 - 6 9}$ | 272 | 91,6 | 281 | 92,2 |
| $\mathbf{7 0 - 7 4}$ | 250 | 91,3 | 259 | 90,5 |
| $\mathbf{7 5 - 7 9}$ | 152 | 87,4 | 178 | 86,7 |
| $\mathbf{8 0 +}$ | 199 | 80,8 | 316 | 69,5 |
| $\mathbf{t o t a l}$ | $\mathbf{3 6 1 4}$ | $\mathbf{8 5 , 2}$ | $\mathbf{3 7 1 5}$ | $\mathbf{8 6 , 4}$ |

a. What percentage of eligible female voters older than 69 voted in the election? (5p) Choose the alternative closest to your own answer.
(A) $20.3 \%$
(B) $21.9 \%$
(C) $80.8 \%$
(D) $82.2 \%$
(E) $83.9 \%$

B Find the interval that contains the first quartile for age among men who voted. (5p) Tip: First calculate the number of voters in each category.
(A) 18-24
(B) $\quad 25-29$
(C) $\quad 30-34$
(D) $\quad 35-39$
(E) 40-44

## Problem 2

The following table describes a random variable $X$. Find the variance of $\boldsymbol{X}$. (5p)

| $x$ | -1 | 0 | 1 |
| :---: | :---: | :---: | :---: |
| $\mathrm{P}(X=x)$ | 0.4 | 0.2 | 0.4 |

a. Find the variance of $\boldsymbol{X}$. (5p) Choose the alternative closest to your answer.
A) 0
B) 0.25
C) 0.40
D) 0.50
E) 0.80

A studio software company has analyzed its customer database and the sales figures for a particular software. The software is available in two versions: the "Lite" version and the more expensive "Pro" version. Based on sales records, $50 \%$ of the customers were in the age group 16-24, 30\% were in the age group 25-34 and the remaining $20 \%$ were 35 and older. The relative frequencies of the two software versions for each of the customer categories is as follows:

|  | $16-24$ | $25-34$ | $35+$ |
| :--- | :--- | :--- | :--- |
| Lite | $80 \%$ | $60 \%$ | $25 \%$ |
| Pro | $20 \%$ | $40 \%$ | $75 \%$ |

b. What is the probability that a randomly chosen customer purchased the Pro version? (5p) Choose the alternative closest to your answer.
A) 0.22
B) 0.27
C) 0.37
D) 0.45
E) 0.48

A test for celiac disease (an autoimmune disorder that causes gluten intolerance) is $93 \%$ accurate when the person does have the disease, and $97 \%$ accurate when the person does not have the disease. Suppose that $1 \%$ of the population of some country has this disease.
c. We test a randomly selected person from the population - and the test is positive (so the test indicates celiac disease). Find the probability that the test shows the correct result. (5p)
Choose the alternative closest to your answer.
A) 0.12
B) 0.25
C) 0.53
D) 0.77
E) 0.93
(Note: In this problem, a patient is tested at random. In practice, patients are tested because the show symptoms that are typical of the disease. When this is the case, the test will be much more accurate. You should not administer this test at random!)

## Problem 3

A pizzeria sells pizzas for $€ 10$ each. Suppose that the number of pizzas sold during a particular week is approximately normally distributed with mean 1500 and standard deviation 180.
a. Find the probability that the revenue (total sales) from pizza is greater than $\mathbf{€ 1 8 0 0 0}$ that week. (5p) Choose the alternative closest to your answer.
A) $0 \%$
B) $5 \%$
C) $50 \%$
D) $95 \%$
E) $100 \%$

The pizzeria sells only two variations of pizza: Margarita and Marinara. Past sales data shows that $25 \%$ of customers prefer Marinara, while $75 \%$ of customers prefer Margarita.
b. Suppose that we randomly select 16 customers. What is the probability that at least 4 out of these 16 customers prefer the Marinara pizza? (5p) Choose the alternative closest to your answer.
(A) $37 \%$
(B) $40 \%$
(C) $60 \%$
(D) $63 \%$
(E) $66 \%$
c. Suppose that we randomly select 100 customers. Find the approximate probability that at least $\mathbf{3 0}$ of these $\mathbf{1 0 0}$ customers prefer the Marinara pizza. Use approximation method taught in the course. (5p) Choose the alternative closest to your answer.
A) $0 \%$
B) $15 \%$
C) $41 \%$
D) $85 \%$
E) $100 \%$

## Problem 4

A statistics student wants to estimate the mean age of first-year business students. She collects a simple random sample of 30 business students from Stockholm University and a sample of 40 business students from Uppsala University.

|  | Sample mean | Sample Standard Deviation | n |
| :--- | :--- | :--- | :--- |
| Stockholm | 21.93 | 4.95 | 30 |
| Uppsala | 22.52 | 4.56 | 40 |

a. Find $\mathbf{a} \mathbf{9 0 \%}$ confidence interval for the difference in mean age between the two populations of students (Stockholm minus Uppsala). (5p) Choose the alternative closest to your answer.
(A) $(-1.46,0.28)$
(B) $(-2.29,1.11)$
(C) $(-2.49,1.31)$
(D) $(-2.86,1.68)$
(E) $(-3.26,2.08)$

As part of a scientific study, a random sample of 10 overweight volunteers are given a course in nutrition by a nutritionist. The body weight of each participant is measured at the beginning of the study, and then again six months later. Assume that the body weights are normally distributed. You can find the weights in kilograms below:

| Volunteer | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Weight before | 80 | 95 | 78 | 105 | 90 | 90 | 91 | 79 | 115 | 85 |
| Weight after | 80 | 92 | 77 | 100 | 91 | 89 | 93 | 77 | 112 | 85 |

b. Find a 95\% confidence interval for the average weight change, after minus before, of a (future) participant in this type of study. (5p) Choose the alternative closest to your answer.
A) $(-2.24,-0.15)$
B) $(-2.37,-0.03)$
C) $(-2.50,-0.10)$
D) $(-2.70,0.30)$
E) $(-11.9,9.5)$

## Problem 5

The scientists in problem $\mathbf{4 b}$ also selected a random sample of 10 overweight volunteers to use as control group. They suspected that just being part of a study at all might have an effect on weight loss. The body weights of the participants in the control group were also measured in the beginning of the study and then again after six months. Assume that the body weights are normally distributed in both groups and that the variances are equal. The weight changes (where a negative means a weight loss) and sample standard deviations can be found in the table below:

|  | Mean weight change | Standard deviation | n |
| :--- | :--- | :--- | :--- |
| Treatment Group | -1.2 | 2.01 | 10 |
| Control Group | -0.5 | 2.00 | 10 |

Test whether the treatment group loses more weight (more negative weight change, use treatment minus control) than the control group. Use $5 \%$ level of significance.
a) Find the decision rule of the test. (5p)
A) Reject $H_{0}$ if $t_{\text {obs }}<-1.73$
B) Reject $H_{0}$ if $t_{o b s}<-1.64$
C) Reject $H_{0}$ if $\left|t_{o b s}\right|>1.64$
D) Reject $H_{0}$ if $\left|t_{o b s}\right|>1.73$
E) Reject $H_{0}$ if $\left|t_{o b s}\right|>1.96$
b. Find the value of the test variable. (5p) Chose the alternative closest to your answer.
A) -0.55
B) -0.78
C) -1.56
D) -2.14
E) -2.28

## Problem 6

A candy manufacturer produces multi-colored button-shaped chocolates. There are five different colors: red, green, blue, yellow, and brown. The manufacturer claims that each color is equally frequent in production, but that the distribution of colors in each individual bag is random. A student collects a random sample of 300 candies and counts the colors. You can find the counts in the table below:

| Red | Green | Blue | Yellow | Brown |
| :--- | :--- | :--- | :--- | :--- |
| 72 | 65 | 67 | 52 | 44 |

Test at the $5 \%$ level of significance whether the population of candies is equally distributed between the five colors.
a) State your hypotheses, test statistic, critical value and decision rule. (5p)
b) Calculate the test variable. (5p)
c) State your conclusions and give a verbal interpretation. (5p)
d) Explain briefly what a type-I error is. Illustrate a situation in which this test would result in a type-I error. (5p)

## Problem 7

An American businessman owns a chain of airport liquor stores. He wants to study the relationship between price and sales for a new brand of bourbon (a type of distilled alcoholic drink). The price varies between his airport stores. In some airports, he has paid for advertising billboards, in other airports, he has no advertising. He uses a random sample of 12 airports to estimate three models:

Model 1: sales $=\beta_{0}+\beta_{1} \cdot$ price $+\varepsilon$
Model 2: sales $=\beta_{0}+\beta_{1} \cdot$ price $+\beta_{2} \cdot a d+\varepsilon$
Model 3: sales $=\beta_{0}+\beta_{1} \cdot$ price $+\beta_{2} \cdot$ ad $+\beta_{3} \cdot($ price $\cdot a d) \cdot+\varepsilon$
sales the number of bottles sold in one week
price the price of one bottle, in dollars
ad a dummy variable; 1 means that he is paying for ads in the airport; 0 means no ads (price $\cdot \mathrm{ad}$ ) an interaction term between price and the dummy variable ad

Parts of the output for each model can be found on the next pages
a) Use Model 2 to find a point estimate for the number of bottles sold, given that the price of one bottle is $\$ 20$ and that the businessman is paying for advertising at that airport. Round to the nearest integer. (5p)
b) Formally test whether Model 3 is better than Model 2 (i.e. test whether or not the interaction term should be included, given that price and $a d$ are included in the model). Use $5 \%$ level of significance. (5p)
c) Calculate and interpret the coefficient of determination for Model 2. (5p)
d) Perform an F-test of Model 3. State the hypotheses and use the p-value to reach a conclusion. Use $5 \%$ level of significance. (5p)
